

# Assignment Questions 5

## Question 1

### Convert 1D Array Into 2D Array

You are given a **0-indexed** 1-dimensional (1D) integer array *original*, and two integers, *m* and *n*. You are tasked with creating a 2-dimensional (2D) array with *m* rows and *n* columns using **all** the elements from *original*.

The elements from indices 0 to *n* - 1 (**inclusive**) of *original* should form the first row of the constructed 2D array, the elements from indices *n* to  $2 * n - 1$  (**inclusive**) should form the second row of the constructed 2D array, and so on.

Return *an m x n 2D array constructed according to the above procedure, or an empty 2D array if it is impossible*.

### Example 1:

**Input:** *original* = [1,2,3,4], *m* = 2, *n* = 2

**Output:** [[1,2],[3,4]]

**Explanation:** The constructed 2D array should contain 2 rows and 2 columns.

The first group of *n*=2 elements in *original*, [1,2], becomes the first row in the constructed 2D array.

The second group of *n*=2 elements in *original*, [3,4], becomes the second row in the constructed 2D array.

## Question 2

You have  $n$  coins and you want to build a staircase with these coins. The staircase consists of  $k$  rows where the  $i$ th row has exactly  $i$  coins. The last row of the staircase **may be** incomplete.

Given the integer  $n$ , return *the number of **complete** rows of the staircase you will build.*

**Example 1:**

**Input:**  $n = 5$

**Output:** 2

**Explanation:** Because the 3rd row is incomplete, we return 2.

### Question 3

Given an integer array `nums` sorted in **non-decreasing** order, return *an array of the squares of each number sorted in non-decreasing order*.

**Example 1:**

**Input:** `nums = [-4,-1,0,3,10]`

**Output:** `[0,1,9,16,100]`

**Explanation:** After squaring, the array becomes `[16,1,0,9,100]`.

After sorting, it becomes `[0,1,9,16,100]`.

### Question 4

Given two **0-indexed** integer arrays `nums1` and `nums2`, return *a list answer of size 2 where:*

- `answer[0]` is a list of all **distinct** integers in `nums1` which are **not** present in `nums2`.
- `answer[1]` is a list of all **distinct** integers in `nums2` which are **not** present in `nums1`.

**Note** that the integers in the lists may be returned in **any** order.

**Example 1:**

**Input:** `nums1 = [1,2,3]`, `nums2 = [2,4,6]`

**Output:** `[[1,3],[4,6]]`

**Explanation:**

For `nums1`, `nums1[1] = 2` is present at index 0 of `nums2`, whereas `nums1[0] = 1` and `nums1[2] = 3` are not present in `nums2`. Therefore, `answer[0] = [1,3]`.

For `nums2`, `nums2[0] = 2` is present at index 1 of `nums1`, whereas `nums2[1] = 4` and `nums2[2] = 6` are not present in `nums2`. Therefore, `answer[1] = [4,6]`.

### Question 5

Given two integer arrays `arr1` and `arr2`, and the integer `d`, *return the distance value between the two arrays.*

The distance value is defined as the number of elements `arr1[i]` such that there is not any element `arr2[j]` where  $|arr1[i] - arr2[j]| \leq d$ .

#### Example 1:

**Input:** `arr1 = [4,5,8]`, `arr2 = [10,9,1,8]`, `d = 2`

**Output:** 2

#### Explanation:

For `arr1[0]=4` we have:

$$|4-10|=6 > d=2$$

$$|4-9|=5 > d=2$$

$$|4-1|=3 > d=2$$

$$|4-8|=4 > d=2$$

For `arr1[1]=5` we have:

$$|5-10|=5 > d=2$$

$$|5-9|=4 > d=2$$

$$|5-1|=4 > d=2$$

$$|5-8|=3 > d=2$$

For `arr1[2]=8` we have:

$$|8-10|=2 \leq d=2$$

$$|8-9|=1 \leq d=2$$

$$|8-1|=7 > d=2$$

$$|8-8|=0 \leq d=2$$

### Question 6

Given an integer array `nums` of length `n` where all the integers of `nums` are in the range `[1, n]` and each integer appears **once** or **twice**, return *an array of all the integers that appears twice*.

You must write an algorithm that runs in  $O(n)$  time and uses only constant extra space.

#### Example 1:

**Input:** `nums = [4,3,2,7,8,2,3,1]`

**Output:**

`[2,3]`

### Question 7

Suppose an array of length `n` sorted in ascending order is **rotated** between 1 and `n` times. For example, the array `nums = [0,1,2,4,5,6,7]` might become:

- `[4,5,6,7,0,1,2]` if it was rotated 4 times.
- `[0,1,2,4,5,6,7]` if it was rotated 7 times.

Notice that **rotating** an array `[a[0], a[1], a[2], ..., a[n-1]]` 1 time results in the array `[a[n-1], a[0], a[1], a[2], ..., a[n-2]]`.

Given the sorted rotated array `nums` of **unique** elements, return *the minimum element of this array*.

You must write an algorithm that runs in  $O(\log n)$  time.

#### Example 1:

**Input:** `nums = [3,4,5,1,2]`

**Output:** 1

#### Explanation:

The original array was `[1,2,3,4,5]` rotated 3 times.

### Question 8

An integer array original is transformed into a **doubled** array changed by appending **twice the value** of every element in original, and then randomly **shuffling** the resulting array.

Given an array changed, return original *if* changed is a **doubled** array. *If* changed is not a **doubled** array, return an empty array. The elements in original may be returned in **any** order.

**Example 1:**

**Input:** changed = [1,3,4,2,6,8]

**Output:** [1,3,4]
